

FATHIA OYINLOYE

QA Engineer · API Testing & Test Automation · Backend Engineering Foundation

+234 704 825 4250 · fathiaoyinloye22@gmail.com · github.com/fathiaoyinloye · LinkedIn · Lagos, Nigeria

PROFESSIONAL SUMMARY

QA Engineer with a backend engineering foundation in Java (Spring Boot) and Python (Django), built through hands-on work on financial-domain systems where testing was treated as a core engineering discipline, not an afterthought. Skilled at writing JUnit 5 and Mockito test suites, designing adversarial test scenarios for atomic transaction logic, performing end-to-end API testing, tracking defects through full lifecycle, and building CI/CD pipelines that enforce automated quality gates on every commit. An Accounting background adds genuine domain fluency in audit trails, idempotency, and data integrity. Works independently, communicates clearly in writing, and is comfortable in fast-moving Agile environments.

CORE QA COMPETENCIES

- Test Design & Execution: Functional, regression, exploratory, boundary, negative, integration, and concurrency/adversarial testing
- Test Planning: Test plan authorship, test case creation, requirement review, edge-case identification during Agile sprint planning
- Defect Management: Bug reporting and full lifecycle tracking via GitHub Issues, severity classification, reproduction steps, fix verification

API & CONTRACT TESTING

- REST API validation with Postman – request/response contracts, HTTP status codes, error handling
- JWT authentication and RBAC authorisation testing across protected endpoints
- Data-integrity validation – cross-referencing API responses against PostgreSQL database state to catch silent backend discrepancies

TEST AUTOMATION

- JUnit 5 and Mockito for unit and integration test suites in Java/Spring Boot projects
- Actively building automation skills in Cypress and Playwright for end-to-end UI testing
- Adversarial and concurrency test scripting for atomic transaction logic (double-spend, race conditions, idempotency)

CI/CD & QUALITY GATES

- Designed and maintained GitHub Actions pipelines that run full test suites on every commit and block merges on failure
- Packaged applications into versioned Docker images and deployed to AWS EC2 as part of automated release pipelines
- Enforced zero-regression quality gates across contributed open-source repositories

DOMAIN EXPERTISE

- Fintech/financial systems: atomic transactions, wallet integrity, audit trails, idempotency – understood from both a technical and Accounting background
- Layered and event-driven architecture awareness, informing risk-based test design

EXPERIENCE

Backend Engineer & Quality Owner – Semicolon Africa

2025 – 2026

Lagos, Nigeria · Full-time, intensive engineering programme · Java · Spring Boot · PostgreSQL · JWT · Spring Security · Agile

- Owned end- to- end quality for API features on a financial- domain application — writing test plans, creating test cases, and executing functional, regression, boundary, and negative test scenarios covering user onboarding, wallet management, and transaction processing.
- Designed adversarial test scenarios to validate atomic transaction logic: concurrent double- spend attempts, zero- balance edge cases, duplicate submissions, and malformed payloads — confirming correctness and idempotency held under every scenario tested, with no inconsistent state surviving.
- Performed systematic API testing across REST endpoints — verifying request/response contracts, HTTP status codes, error handling, JWT authentication enforcement, and RBAC authorisation behaviour before every feature release.
- Validated PostgreSQL database state after each transaction test scenario, cross- referencing API responses against database records to confirm end- to- end data integrity.
- Tracked defects end- to- end using GitHub Issues — writing bug reports with reproduction steps, expected vs. actual behaviour, environment details, and severity ratings, then performing verification testing before closing.
- Participated in Agile sprint ceremonies — reviewing requirements before development began, flagging edge cases and ambiguities early, and completing features across 2- week sprint cycles.

Independent Open Source Contributor

2026 – Present

Remote · Volunteer contributions to open- source Java/Spring Boot and Django repositories · JUnit 5 · Mockito · GitHub Actions · Docker · AWS EC2

- Wrote and maintained automated test suites (JUnit 5, Mockito) for open- source Java/Spring Boot and Django projects, raising test coverage on contributed modules and catching regressions before they reached the main branch.
- Built and maintained a CI- based test automation pipeline using GitHub Actions: triggers on every merge to main, runs the full test suite, packages the application into a versioned Docker image, and deploys to AWS EC2.
- Performed API testing and regression validation on contributed REST endpoints — verifying contracts, authentication, error handling, and edge- case behaviour before raising pull requests for maintainer review.
- Documented test findings and contributed to README guides and inline code comments, lowering the barrier to entry for new contributors.

OmotemmyPay — API & Data Integrity Testing

Python · Django · Django REST Framework · PostgreSQL · JWT · Postman · Functional & Regression Testing

- Designed and executed a structured test suite covering all wallet API endpoints — deposits, transfers, withdrawals, and transaction history — across functional, boundary, negative, and concurrency test scenarios.
- Constructed adversarial scenarios to validate atomic transaction integrity: double- spend attempts, race conditions, and insufficient- balance edge cases — confirming safeguards held under every adversarial input tested.
- Systematically tested authentication and authorisation enforcement — confirming unauthenticated requests, expired tokens, and wrong- role access were correctly rejected at every protected endpoint.
- Validated end- to- end data integrity by cross- referencing API responses against PostgreSQL database state after every test scenario.

SmartBudget — Integration & Regression Testing

Java · Spring Boot · PostgreSQL · Third- Party API Integration · Strategy Pattern · Regression Testing

- Maintained regression test cases for all report- generation modules (monthly summary, category breakdown, spending trends), verifying output accuracy against manually computed expected results across varied datasets.
- Tested third- party API integration failure scenarios — timeouts, malformed responses, partial data, and service unavailability — confirming graceful error handling and consistent data state under all failure conditions.

CI/CD Automated Quality Gate Pipeline

GitHub Actions · JUnit 5 · Docker · AWS EC2 · Automated Test Pipeline

- Designed and implemented a CI- based test automation pipeline: triggers on every commit, runs the complete test suite in a clean Docker environment, blocks merges on failures, and publishes versioned builds to AWS EC2.

TECHNICAL SKILLS

- Languages: Java (primary), Python, JavaScript, TypeScript, SQL
- Frameworks: Spring Boot, Spring Data JPA, Spring Security, Django, Django REST Framework, FastAPI, React
- Databases: PostgreSQL, MySQL, MongoDB (schema- aware testing, query validation, integrity testing)

- Test Tools: Postman, JUnit 5, Mockito, GitHub Issues – Cypress & Playwright (actively learning)
- CI/CD & DevOps: GitHub Actions, Docker, AWS EC2, Git, automated quality gates, versioned deployments
- Methods: Agile/Scrum, test planning, test case writing, sprint reviews, requirement analysis

EDUCATION

Ordinary National Diploma (OND), Accounting

Lagos State Polytechnic, Lagos · 2021 – 2023

Strong foundation in analytical thinking, financial logic, and precision – qualities that directly support quality assurance, data validation, and defect detection.
