

Day 06: BreakFast

You are given a string that contains alphanumerics and symbols. Write a function that will return you all the permutations of capitalizations.

For example:

Input => 'abc'

Output => ['abc', 'Abc', 'aBc', 'abC', 'ABc', 'AbC', 'aBC', 'ABC']

The permutations can be stored in any order inside the array, as long as all possible permutations are contained.

semicolon _____
