

Write a function that takes a list of numbers and determines whether all the elements are perfect squares (e.g., $4 = 2^2$, $9 = 3^2$, $25 = 5^2$). The function should return True if every number in the list is a perfect square, and False otherwise. Use TDD. Be sure to handle edge cases.

```
test_list = [4, 9, 25, 49]
```

```
sample run : get_perfect_square(test_list)
```

```
sample output: [True, True, True, True]
```

semicolon

Write a function that takes a list of strings and returns a list of booleans indicating whether each string is a palindrome (reads the same backward and forward).

```
test_list = ["madam", "racecar", "hello", "noon"]  
sample run: get_palindrome_flags(test_list)  
sample output: [True, True, False, True]
```

semicolon

Ensure you follow TDD practices, handle all edge cases, create a folder named day4, and complete the task in Java, Python, and JavaScript.

semicolon
