

Typing Speed Test

Design and implement a console application that tests a user's typing speed.

The program should display a sentence for the user to type.

It should then record how long the user takes to type the sentence and measure how accurate the typing was.

Finally, the program should display the results. The results should include the following

- Time taken (seconds).
- Words per minute.
- Accuracy percentage.

Formula:

$\text{words_per_minute (wpm)} = \text{number_of_words} / \text{time_in_minutes}$

semicolon
