PROFESSIONAL SUMMARY

Backend Engineer with 1 year of hands-on experience building financial systems in Java (Spring Boot) and Python (Django, FastAPI). Experienced in layered architecture, OOP design patterns, event-driven systems with Apache Kafka, and REST API development. Background in Accounting means financial logic — atomic transactions, audit trails, wallet integrity — is domain knowledge, not just implementation. Takes ownership from schema design to deployment, writes tests as a habit, and uses AI coding tools daily to move faster and write better code.

WORK EXPERIENCE

Backend Engineer — Semicolon Africa

Jan 2025 – Jan 2026

Lagos, Nigeria · Full-time · Java · Spring Boot · PostgreSQL · JWT · Agile

- Engineered REST APIs in Java and Spring Boot covering user onboarding, wallet management, and transaction processing — owning each feature end-to-end from schema design to deployment.
- Designed PostgreSQL schemas with strict integrity constraints across wallet, transaction, and user tables, ensuring audit-ready records with zero tolerance for inconsistent state.
- Eliminated double-spend and race condition errors by enforcing atomic transaction logic, validated through edge-case test scenarios that confirmed no inconsistency survived under concurrent inputs.
- Locked down all financial endpoints with JWT authentication and role-based access control — no wallet operation executable without verified authorization.
- Delivered features across 2-week Agile sprint cycles in a team environment, contributing to sprint planning, daily standups, code reviews, and retrospectives.

Open Source Contributor — GitHub Community Projects2024 – Present

Remote · Volunteer · Java · Spring Boot · Django · GitHub Actions · Docker · AWS EC2

- Shipped multiple pull requests across open source Java/Spring Boot and Django projects, iterating through full maintainer code-review cycles until merged.
- Wrote a GitHub Actions CI/CD script that automates the full release pipeline: on every merge to main, it builds the Spring Boot application, runs the test suite, packages the app into a Docker image with an auto-incremented version tag, pushes it to Docker Hub, then SSH-deploys the updated container to a live AWS EC2 instance — eliminating all manual build, push, and deploy steps.
- Raised test coverage on contributed modules by writing JUnit 5 and Mockito suites, catching regressions before they reached main branch.
- Maintained README documentation and inline comments on contributed code, lowering the barrier for new contributors joining the projects.

PROJECTS

OmotemmyPay — Digital Wallet Platform2024 – 2025

Python · Django · Django REST Framework · PostgreSQL · JWT Auth

- Built a full digital wallet application: user registration, wallet creation, fund deposits, peer-to-peer transfers, and complete transaction history — all via a versioned REST API.
- Validated atomic transaction logic by constructing targeted test scenarios designed to trigger double-spend conditions, confirming the safeguard held under all adversarial inputs.
- Enforced authentication and session management across every endpoint; no wallet operation executes without a verified, authorized user session.
- Designed the PostgreSQL schema with balance validation constraints, transaction integrity rules, and audit-ready record structures applicable to savings and portfolio systems.

SmartBudget — Budget Tracking App2024 – 2025

Java · Spring Boot · Layered Architecture · Strategy Pattern · External API · PostgreSQL

- Built a backend budgeting application using layered architecture (controller, service, repository), keeping each concern independently testable and the codebase easy to extend.

- Implemented the Strategy Pattern to power a pluggable report generation engine — monthly summary, category breakdown, and spending trends each encapsulated as an interchangeable strategy with zero changes to core logic on extension.
- Integrated a third-party financial insights API post-computation: handled timeouts, unexpected responses, and error scenarios, merging enriched data cleanly into the final report response.
- Delivered in self-directed Agile sprints — breaking features into tasks, tracking on a board, and iterating based on test feedback.

Food Notification System — Kafka Event Pipeline2024

Java · Spring Boot · Apache Kafka

- Built a Kafka-based event pipeline from scratch: broker configuration, topic creation, producers, consumers, partition assignment, consumer groups, and offset management end-to-end.
- Tested message flow under failure conditions — consumer restarts, delayed messages, and offset resets — confirming reliable delivery and correct recovery at every stage.

Library Management System2023 – 2024

Python · Java · Custom Persistence

- Maintained 99% data consistency across full CRUD operations and built a borrow-history recommendation algorithm that categorized and surfaced relevant titles across 200+ records.

TECHNICAL SKILLS

Languages: Java (primary), Python, JavaScript, TypeScript, SQL
Frameworks: Spring Boot, Spring Data JPA, Spring Security, Django, Django REST Framework, FastAPI, React
Databases: PostgreSQL (schema design, query optimisation, transactions, constraints), SQL, custom persistence
Architecture & Patterns: Layered Architecture, Event-Driven Architecture, Strategy Pattern, OOP Design Patterns, REST API Design
DevOps & Tools: Git, GitHub Actions (CI/CD), Docker, AWS EC2, Apache Kafka, IntelliJ IDEA, VS Code
Testing & Methods: JUnit 5, Mockito, integration testing, atomic transaction testing, Agile/Scrum, Big O Analysis
Fintech Domain: Wallet management, atomic transactions, JWT auth, RBAC, audit trails, idempotency, financial reporting

EDUCATION

Software Engineering Programme — Semicolon Africa <i>Lagos, Nigeria</i>	2025 – 2026
OND Accounting — Lagos State Polytechnic <i>Lagos, Nigeria</i>	2021 – 2023
