PROFESSIONAL SUMMARY

Detail-oriented QA Engineer with a backend engineering foundation — 1 year of production experience building financial systems in Java (Spring Boot) and Python (Django), where testing was never optional. I understand how systems are architected, which means I know exactly where they are most likely to fail. I have written JUnit 5 and Mockito test suites, designed adversarial test scenarios to validate atomic transaction logic, performed end-to-end API testing, tracked defects through full lifecycle in GitHub Issues, and built CI/CD pipelines (GitHub Actions) that enforce automated quality gates on every commit. My Accounting background gives me genuine domain fluency in financial systems — audit trails, idempotency, and data integrity are concepts I understand from both a business and technical perspective. I work independently, communicate clearly in writing, and thrive in fast-moving Agile environments.

CORE COMPETENCIES

API Testing · Postman · REST API Validation · Functional Testing · Regression Testing · Exploratory Testing · Boundary & Negative Testing · Test Case Creation & Execution · Test Planning · Bug Reporting · Defect Tracking · GitHub Issues · CI/CD Test Pipelines · GitHub Actions · JUnit 5 · Mockito · Unit Testing · Integration Testing · Atomic Transaction Testing · Data Validation · JWT & Auth Testing · Agile/Scrum · Java · Python · PostgreSQL · Docker · Cypress (learning) · Playwright (learning)

WORK EXPERIENCE

Backend Engineer & Quality Owner · Semicolon Africa

2025 – 2026

Lagos, Nigeria · Full-time · Java · Spring Boot · PostgreSQL · JWT · Spring Security · Agile

- Owned end-to-end quality for all API features on a live financial platform — writing test plans, creating test cases, and executing functional, regression, boundary, and negative test scenarios covering user onboarding, wallet management, and transaction processing.
- Designed adversarial test scenarios to validate atomic transaction logic: concurrent double-spend attempts, zero-balance edge cases, duplicate submissions, and malformed payloads — confirming correctness and idempotency held under all tested conditions with zero inconsistent state surviving.
- Performed systematic API testing across all REST endpoints — verifying request/response contracts, HTTP status codes, error handling, JWT authentication enforcement, and RBAC authorisation behaviour before every feature release.
- Validated PostgreSQL database state after every transaction test scenario, cross-referencing API responses against database records to confirm end-to-end data integrity and catch any silent backend discrepancies.
- Tracked defects end-to-end using GitHub Issues — writing clear bug reports with reproduction steps, expected vs actual behaviour, environment details, and severity ratings, then performing verification testing to confirm fixes before closing.
- Participated in Agile sprint ceremonies — reviewing requirements before development began, flagging edge cases and ambiguities early, contributing to retrospectives, and completing features across 2-week sprint cycles.

QA Contributor & Open Source Engineer · GitHub Community Projects

2026 – Present

Remote · Volunteer · Java · Spring Boot · Django · JUnit 5 · Mockito · GitHub Actions · Docker · AWS EC2

- Created and maintained automated test suites (JUnit 5, Mockito) for open source Java/Spring Boot and Django projects — raising test coverage on contributed modules and catching regressions before they reached the main branch.
- Built and maintained a CI-based test automation pipeline using GitHub Actions: triggers on every merge to main, runs the full test suite, packages the application into a versioned Docker image, and deploys to AWS EC2 — enforcing zero-regression quality gates automatically.
- Performed API testing and regression validation on contributed REST endpoints — verifying contracts, authentication, error handling, and edge case behaviour before raising pull requests for maintainer review.
- Documented test findings and contributed to README guides and inline code comments, improving clarity and lowering the barrier for new contributors joining the projects.

QUALITY ASSURANCE PROJECTS

OmotemmyPay — API & Data Integrity Testing

2024 – 2025

Python · Django · Django REST Framework · PostgreSQL · JWT · Postman · Functional & Regression Testing

- Designed and executed a structured test suite covering all wallet API endpoints — deposits, transfers, withdrawals, and transaction history — across functional, boundary, negative, and concurrency test scenarios.
- Constructed targeted adversarial scenarios to validate atomic transaction integrity: double-spend attempts, race conditions, and insufficient-balance edge cases — confirming safeguards held under all adversarial inputs.
- Tested authentication and authorisation enforcement systematically — confirming that unauthenticated requests, expired tokens, and wrong-role access were correctly rejected at every protected endpoint.

- Validated end-to-end data integrity by cross-referencing API responses against PostgreSQL database state after every test scenario, detecting any discrepancy between application layer and persistence layer.

SmartBudget — Integration & Regression Testing

2024 – 2025

Java · Spring Boot · PostgreSQL · Third-Party API · Strategy Pattern · Regression Testing

- Maintained regression test cases for all report generation modules (monthly summary, category breakdown, spending trends) — verifying output accuracy against manually computed expected results across varied datasets.
- Tested third-party API integration failure scenarios: timeouts, malformed responses, partial data, and service unavailability — confirming graceful error handling and consistent data state under all failure conditions.

CI/CD Automated Quality Gate Pipeline²⁰²⁶

GitHub Actions · JUnit 5 · Docker · AWS EC2 · Automated Test Pipeline · CI-Based Automation

- Designed and implemented a full CI-based test automation pipeline: triggers on every commit, runs the complete test suite in a clean Docker environment, blocks merges on failures, and publishes versioned builds to AWS EC2 — directly implementing automated quality gate enforcement.

TECHNICAL SKILLS

API Testing: Postman, REST API validation, contract testing, auth & RBAC testing, HTTP status verification

Test Types: Functional, regression, exploratory, boundary, negative, integration, data validation, concurrent/adversarial

Test Automation: JUnit 5, Mockito, GitHub Actions CI pipelines — Cypress & Playwright (actively learning)

Bug Tracking: GitHub Issues, defect lifecycle, bug report writing, severity classification, fix verification

CI/CD & DevOps: GitHub Actions, Docker, AWS EC2, Git, automated quality gates, versioned deployments

Languages: Java (primary), Python, JavaScript, TypeScript, SQL

Frameworks: Spring Boot, Spring Data JPA, Spring Security, Django, Django REST Framework, FastAPI, React

Databases: PostgreSQL (schema-aware testing, query validation, integrity testing), SQL

Architecture: Layered Architecture, Event-Driven Architecture, REST API Design, OOP Design Patterns

Methods: Agile/Scrum, test planning, test case writing, sprint reviews, requirement analysis

Fintech Domain: Atomic transactions, JWT auth, RBAC, audit trails, idempotency, wallet integrity

Developing: Cypress, Playwright, Selenium, performance testing, BDD frameworks

EDUCATION

Software Engineering Programme — Semicolon Africa, Lagos

2025 – 2026

Intensive engineering programme covering software testing, system design, data structures & algorithms, CI/CD, cloud deployment, and Agile delivery.

Ordinary National Diploma (OND), Accounting — Lagos State Polytechnic, Lagos

2021 – 2023

Strong foundation in analytical thinking, financial logic, and precision — core qualities that directly support quality assurance, data validation, and defect detection.
